

Image-Based Situation Awareness Audit 1.3.2018

Sakari Lampola

Previous Audit 11.1.2018

Previous Audit

Open questions:

- Role of classical object tracking alrorithms?
- What to do with multiple bounding boxes around one object?
- Appropriate minimum confidence level?
- What to do with false detections inside other objects?
- What to do with false detections from the background?
- How to set Kalman filter parameters for image object filtering?
- Hungarian algorithms special case for hidden objects

To do:

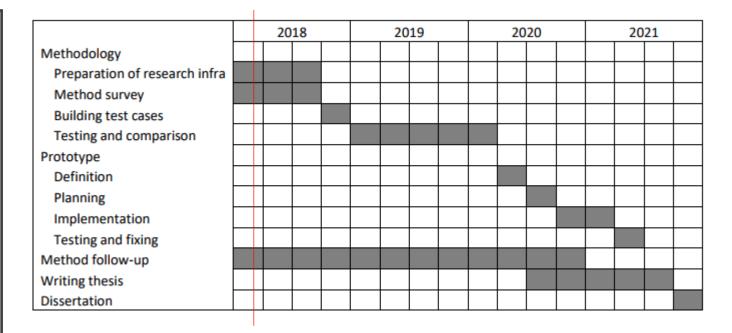

- Close open questions
- Image object status
- Image object velocity estimation
- Probabilistic approach for matching detected and image objects
- 2d -> 3d transformation
- World object state estimation

Other:

- Semantic segmentation
- Organisations to follow: ICCV, ICRA, NIPS, IROS, arXiv
- Camera motion (yaw, pitch)
- Grid or continuos presentation?
- Class specific attributes
- Object history

Project Plan

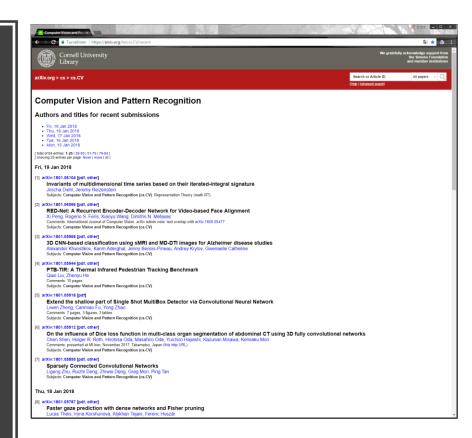

Project Plan

- 1. Methodology / Preparation of research infra
 - a. Software platforms are constructed and tested
 - b. Off-the-shelf models are acquired and tested
 - c. Necessary skills on platforms are learned
- 2. Methodology / Method survey
 - a. Current state-of-art methods are studied
 - b. Methods are constructed and tested on the software platforms
- 3. Method follow-up
 - a. Screening of conference papers related to the subject
 - b. Possibly integrating new methods to the project

Work Done

Method Follow-Up

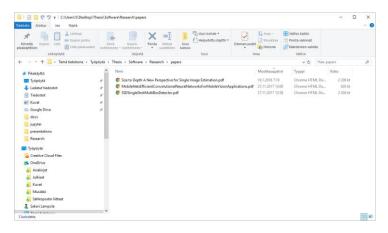

Image object velocity is necessary for:

- predicting image object locations when matching new measurements
- identifying image objects
- predicting image object locations for hidden objects

Estimation algorithm

Image Object Kalman Filtering

Bounding box corner location

State vector s:

$$s = \begin{bmatrix} l \\ v \end{bmatrix}$$

I = location coordinate $(x_{min}, x_{max}, y_{min}, y_{max})$ of the bounding box corner in the image $v = velocity (vx_{min}, vx_{max}, vy_{min}, vy_{max})$ of the bounding box corner in the image

State equation in differential form:

$$\frac{ds(t)}{dt} = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} * s(t) + \epsilon(t) = A_1 * s$$

State equation in difference form:

$$s(k+1) = (I + \Delta * A_1) * s(k) + \epsilon(k)$$

$$= \begin{bmatrix} 1 & \Delta \\ 0 & 1 \end{bmatrix} * s(k) + \varepsilon(k) = A * s(k) + \varepsilon(k)$$

where Δ is the time increment and ε Gaussian noise with covariance R.

Measurement equation

$$z(k) = [1 \ 0] * s(k) + \delta(k) = C * s(k) + \delta(k)$$

Where δ is Gaussian noise with covariance matrix Q.

Kalman filter initialization:

$$\mu(0) = \begin{bmatrix} l(0) \\ 0 \end{bmatrix}$$

where I(0) is the first location measurement

$$\Sigma(0) = \begin{bmatrix} 10.0 & 0 \\ 0 & 10000.0 \end{bmatrix}$$

where 10.0 and 10000.0 are believed initial error variances of location and velocity.

Image object

- id
- status
- x min
- x max
- y min
- y max
- vx min
- vx max
- vy_min
- vy_max
- class
- confidence
- appearance

$$R = \begin{bmatrix} 1.0 & 0 \\ 0 & 1.0 \end{bmatrix}$$

where diagonal elements are believed state equation variances of location and velocity.

$$Q = [10.0]$$

Where 10.0 is the believed measurement variance.

Kalman filter update:

$$\mu_1(k) = A * \mu(k-1)$$

$$\Sigma_1(k) = A * \Sigma(k-1) * A^T + R$$

$$K(k) = \Sigma_1(k) * C^T * (C * \Sigma_1(k) * C^T + Q)^{-1}$$

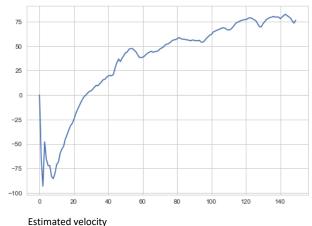

$$\mu(k) = \mu_1(k) + K(k) * (z(k) - C * \mu_1(k))$$

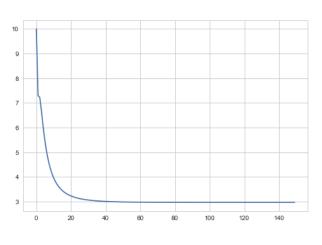

$$\Sigma(k) = (I - K(k) * C) * \Sigma_1(k)$$

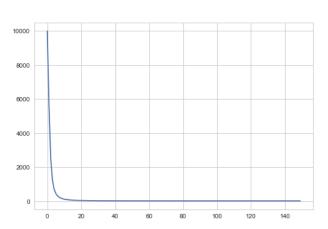

Numerical values are estimated using grid search and 10 step ahead mean prediction error. Values rounded. Later adjusted by experiments.

Moving object (car)

Location variance

Velocity variance

Moving object (car)

10 step ahead mean prediction error

Static object (calf)

40 30 20 10 0 20 40 80 80 100 120 140 160

Measured and filtered location (upper left corner)

Estimated velocity

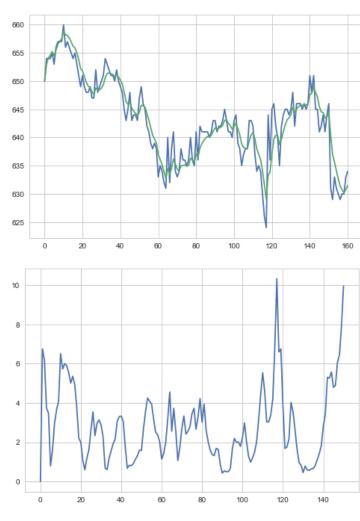

Location variance

Velocity variance

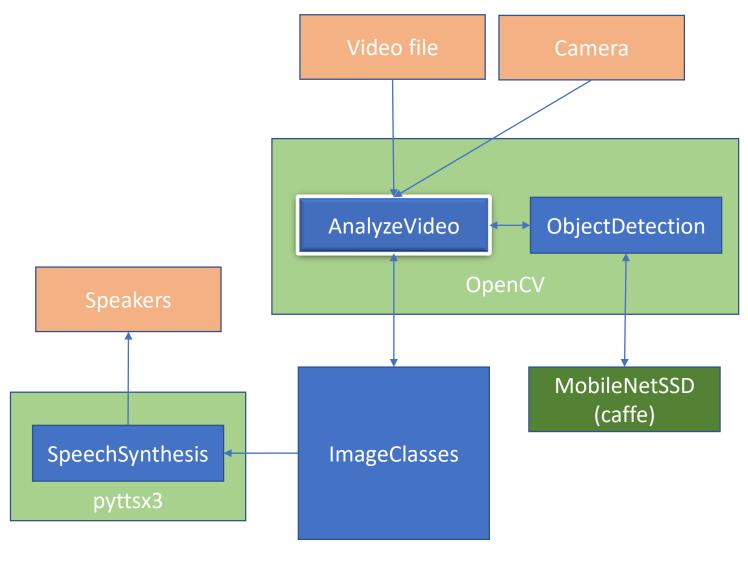

Static object (calf)

10 step ahead mean prediction error

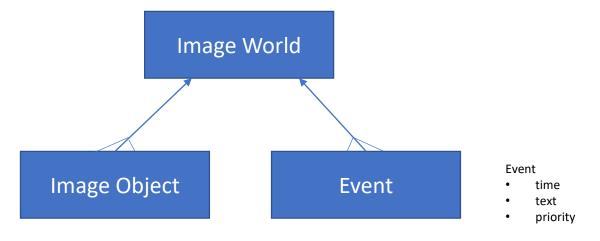

Speech Synthesis

Software Architecture

Speech Synthesis

Entities

- Event is generated when
 - new image object is created
 - image object status is changed
- Event will pause the video for the duration of speech (not in the final version)
- Events are collected (history)

Confidence Level

SSD Mobilenet implementation:

extract the confidence (i.e., probability) associated with the prediction

4	A	В	С	D	Е	F	G	Н	1	J
1	Objects detected		Confidence level

40										

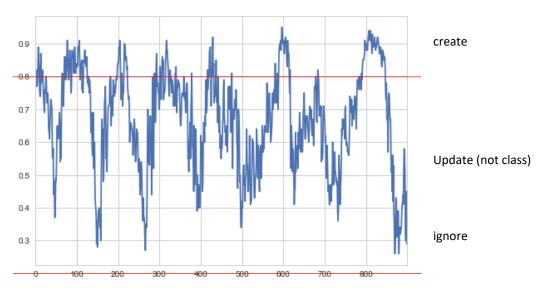

Good value for creating a new image object is between 0.8 and 0.9.

The 'good' value also depends on other hyperparameters.

Confidence Level

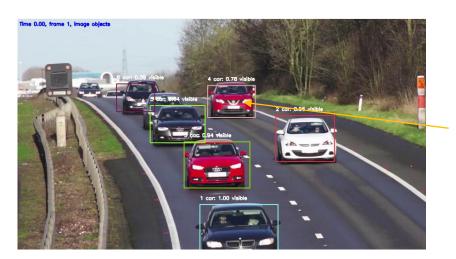

Confidence level has dynamics

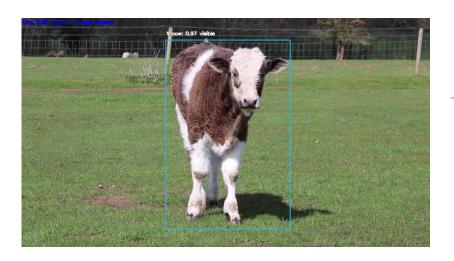

Different levels for creating and updating image object. Hyperparameters:

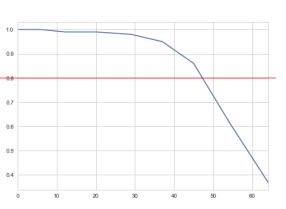

- CONFIDENCE_LEVEL_CREATE (0.8)
- CONFIDENCE_LEVEL_UPDATE (0.2)

Confidence Level

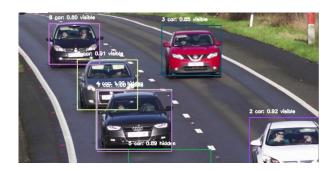

Border Behaviour

Box size and form distorded

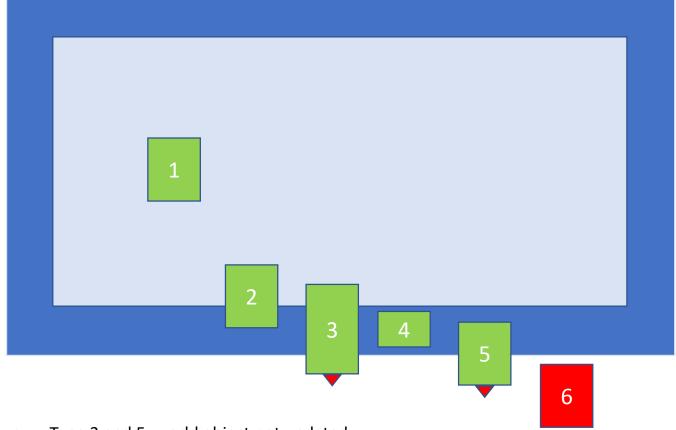

x_max_c x_max_m x_max_p y_max_c y_max_m y_max_

Hyperparameter BORDER_WIDTH (30)

In [10]: # image size 1280 * 72

Border Behaviour

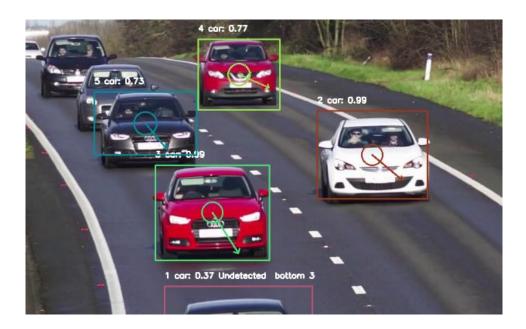

- Type 3 and 5: world object not updated
- Type 6: removed, world object acceleration fixed
- If an object touches 3 borders, it is removed

Done for:

- left
- right
- top
- bottom

Visual Presentation

- Ellipse axes proportional to the standard deviation of the location (2*std, corresponding to 95% probability)
- Arrow direction and length proportional to velocity (measured in pixels/second)

Object Retention

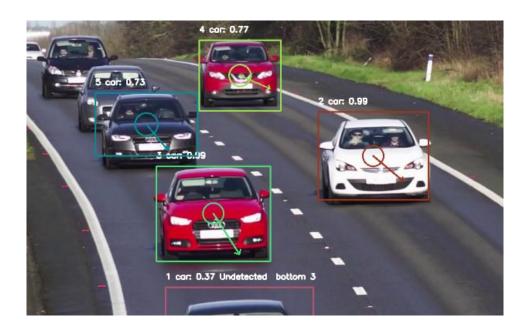

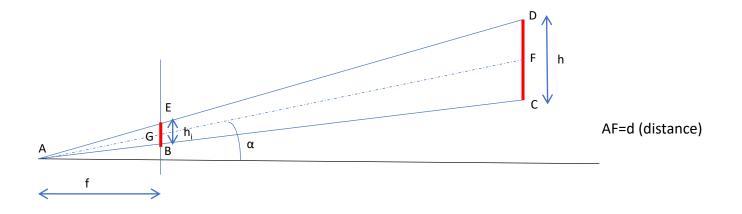

Image objects are removed if not detected in RETENTION_COUNT_MAX (30) successive frames.

Distance Estimation

Similar triangles AGE and AFD:

$$\frac{0.5 * h_i}{0.5 * h} = \frac{AG}{d} = \frac{\frac{f}{\cos(\alpha)}}{d} = \frac{f}{d * \cos(\alpha)}$$

$$d = \frac{f * h}{\cos(\alpha) * h_i}$$

Similar equations for horizontal direction $(\beta=azimuth)$

Distance Estimation

$$d = \frac{f * h}{\cos(\alpha) * \cos(\beta) * h_i} = \frac{f * h}{\cos(\alpha) * \cos(\beta) * h_i * s_h/p_h}$$

 $s_w = sensor \ width \ (m)$ $s_h = sensor \ height \ (m)$ $p_w = image \ width \ (pixels)$ $p_h = image \ height \ (pixels)$ $h_i = object \ height \ (pixels)$ $h = object \ height \ (m)$ $f = focal \ length \ (m)$ $\alpha = altitude \ (rad)$ $\beta = azimuth \ (rad)$

Example (Nikon D800E):

 $s_w = sensor width (m) = 0.0359 m$

 s_h = sensor height (m) = 0.0240 m

 p_w = image width (pixels) = 7360

 p_h = image height (pixels) = 4912

 h_i = object height (pixels) = 100

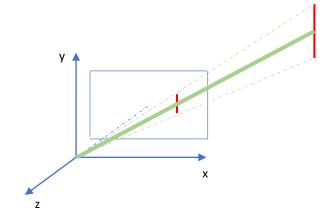

h = object height (m) = 1.0 m

f = focal length (m) = 0.050 m

 α = altitude (rad) = 0.0

 β = azimuth (rad) = 0.0

$$d = \frac{0.050m * 1m}{1.0*1.0*100*0.024m/4912} = 102.33 m$$

From pixel coordinates (sensor plane) to 3d camera coordinates:

$$(x_c, y_c, z_c) = (-\frac{s_w}{2} + xp^* \frac{s_w}{p_w}, \frac{s_h}{2} - yp^* \frac{s_h}{p_h}, -f)$$

Object center will be on the line:

$$(x_0, y_0, z_0) = t^* (x_c, y_c, z_c)$$

The length of the line is:

$$d = \frac{f * h}{\cos(\alpha) * \cos(\beta) * h_i * s_h/p_h} \qquad \alpha = \arctan(y_c/f)$$

$$\beta = \arctan(x_c/f)$$

 s_w = sensor width (m) s_h = sensor height (m) p_w = image width (pixels) p_h = image height (pixels) h_i = object height (pixels) h = object height (m) f = focal length (m) α = altitude (rad)

$$t^2 * (x_c^2 + y_c^2 + z_c^2) = d^2$$

$$t = \frac{d}{\sqrt{{x_c}^2 + {y_c}^2 + {z_c}^2}}$$

Example:

 s_w = sensor width (m) = 0.0359 m s_h = sensor height (m) = 0.0240 m p_w = image width (pixels) = 7360 p_h = image height (pixels) = 4912 h_i = object height (pixels) = 100 h = object height (m) = 1.0 m f = focal length (m) = 0.050 m x_p = 1200 y_p = 2000

$$(x_c, y_c, z_c) = (-\frac{s_w}{2} + xp * \frac{s_w}{p_w}, \frac{s_h}{2} - yp * \frac{s_h}{p_h}, -f)$$

=
$$\left(-\frac{0.0359}{2} + 1200 * \frac{0.0359}{7360}, \frac{0.0240}{2} - yp * \frac{0.0240}{4912}, -0.050\right)$$
 = (-0.0121, 0.0022, -0.0500)

$$\alpha = \arctan(y_c/f) = 0.0445$$
 $\beta = \arctan(x_c/f) = -0.2374$

$$d = \frac{f * h}{\cos(\alpha) * \cos(\beta) * h_i * s_h/p_h}$$

$$= \frac{0.050*1}{\cos(0.0445)*\cos(-0.2374)*100*0.0240/4912} = 105.39$$

$$t = \frac{105.39}{\sqrt{-0.0121^2 + 0.0022^2 + -0.0500^2}} = 2.0468e + 03$$

Object location in 3d camera coordinates:

$$(x_o, y_o, z_o) = t^* (x_c, y_c, z_c)$$

= 2.0468e+03 * (-0.0121, 0.0022, -0.0500)
(-24.7593, 4.5602, -102.3389)

Open questions:

- Derivation ok?
- Assumptions ok?
 - Optical axis in sensor center?

Parameters:

```
s<sub>w</sub>= sensor width (m)

s<sub>h</sub>= sensor height (m)

p<sub>w</sub>= image width (pixels)

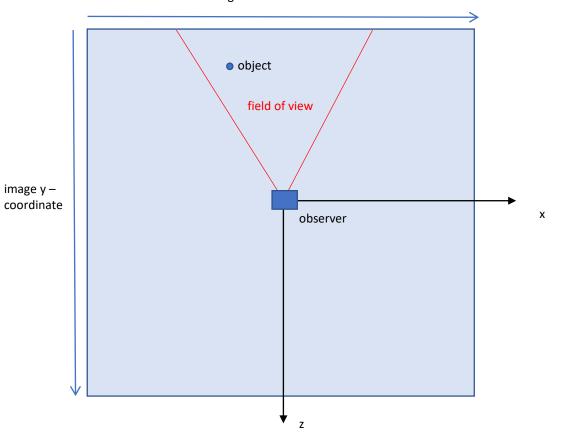

p<sub>h</sub>= image height (pixels)

f = focal length (m)
```

Open questions:

- Video metadata often lacks sensor and focal parameters
- Focal length can change during shooting (zooming)

Map Presentation

 $x_w = object \ world \ x \ coordinate \ (m)$ $z_w = object \ world \ z \ coordinate \ (m)$ $x_i = object \ image \ x \ coordinate \ (pixel)$ $y_i = object \ image \ y \ coordinate \ (pixel)$ $h_w = image \ area \ world \ height \ (m)$ $h_i = image \ area \ image \ height \ (pixels)$ $w_w = image \ area \ world \ width \ (m)$ $w_i = image \ area \ image \ width \ (pixels)$

$$(x_i, y_i) = (\frac{w_i}{2} + x_w^* \frac{w_i}{w_w}, \frac{h_i}{2} + zw^* \frac{h_i}{h_w})$$

$$\frac{w_i}{w_w} = \frac{h_i}{h_w} = p$$
 (pixel/meter ratio)

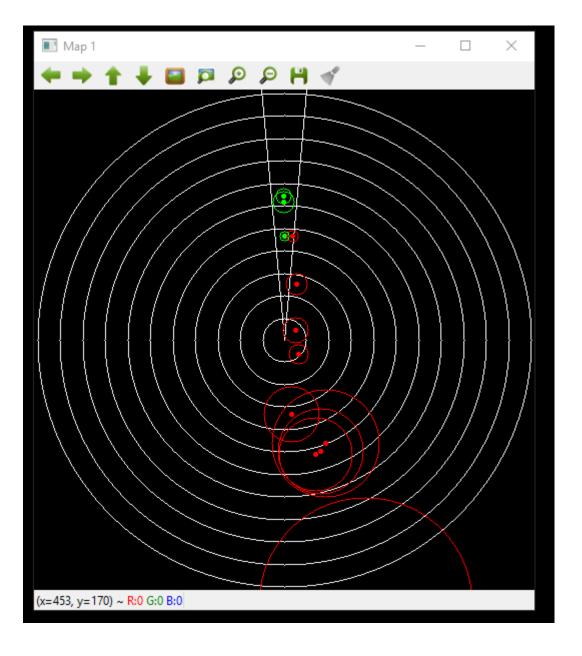

$$(x_i, y_i) = (\frac{w_i}{2} + x_w^* p, \frac{h_i}{2} + zw^*p)$$

Map Presentation

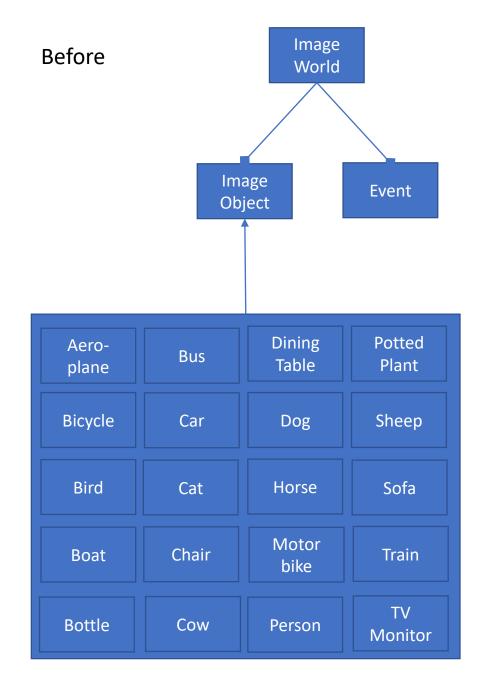

$$FOV = 2 * atan(\frac{s_w}{2 * f})$$
 $s_w = sensor \ width \ (m)$ $f = focal \ length \ (m)$

Map Presentation

Entity Diagram

Detected Object

Entity Diagram

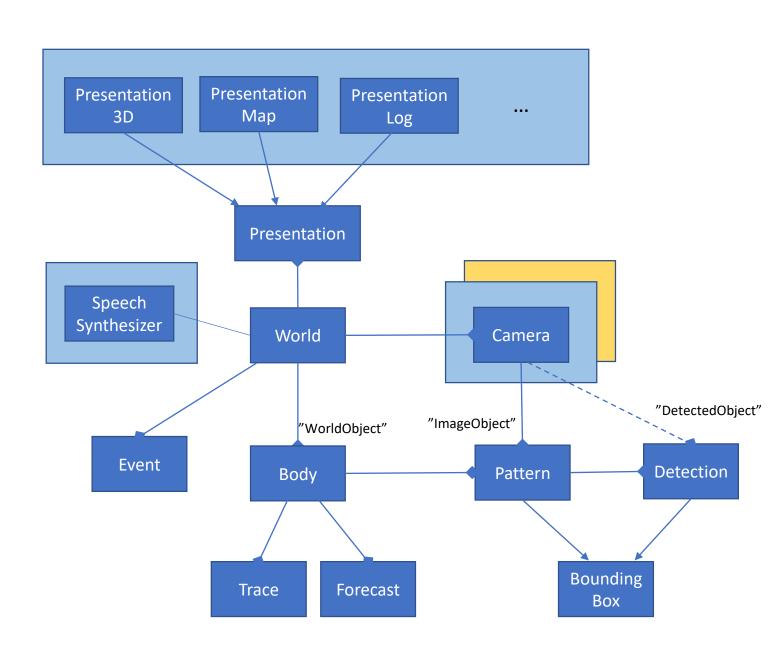

V2.0 goal

- Detected classes not hardcoded
- Object class may change
- Support for many cameras, rotations
- Names less awkward
- Cleaning
- Python style guide followed, excluding line length
- Code optimization
- One package

Name of the software package: ShadowWorld

(Plato: Allegory of the Cave)

Entity Diagram

Body Kalman Filtering

- Second order model does not work, constant acceleration makes bodies bounce back or get enormous velocities.
- In world, constant acceleration for several (tens) of seconds is not common
- First order model works! (No wonder it's popular in robotics...)
- When measurement is lost, the body is switched into constant velocity mode
- In filtering terminology: velocity mode = only prediction, no correction
- Algorithms described in [docs] folder documents

Body Kalman Filtering

State vector s:

$$s = \begin{bmatrix} x \\ y \\ z \\ v_x \\ v_y \\ v_z \end{bmatrix}$$

where

(x, y, z) = location of the world object center point (v_x, v_y, v_z) = velocity of the object

State equation in differential form:

State equation in difference form:

$$s(k+1) = (I + \Delta * A_1) * s(k) + \epsilon(k)$$

$$= \begin{bmatrix} 1 & 0 & 0 & \Delta & 0 & 0 \\ 0 & 1 & 0 & 0 & \Delta & 0 \\ 0 & 0 & 1 & 0 & 0 & \Delta \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix} * s(k) + \varepsilon(k) = A * s(k) + \varepsilon(k)$$

where Δ is the time increment and ε Gaussian noise with covariance R.

Measurement equation

$$z(k) = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \end{bmatrix} * s(k) + \delta(k) = C * s(k) + \delta(k)$$

Where δ is Gaussian noise with covariance matrix Q.

Kalman filter initialization:

$$\mu(0) = \begin{bmatrix} x(0) \\ y(0) \\ z(0) \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

where x(0), y(0), z(0) is the first location measurement.

$$\Sigma(0) = \begin{bmatrix} \alpha & 0 & 0 & 0 & 0 & 0 \\ 0 & \alpha & 0 & 0 & 0 & 0 \\ 0 & 0 & \alpha & 0 & 0 & 0 \\ 0 & 0 & 0 & \beta & 0 & 0 \\ 0 & 0 & 0 & 0 & \beta & 0 \\ 0 & 0 & 0 & 0 & 0 & \beta \end{bmatrix}$$

where α and β are believed variances of location and velocity.

$$R = \begin{bmatrix} r_1 & 0 & 0 & 0 & 0 & 0 \\ 0 & r_1 & 0 & 0 & 0 & 0 \\ 0 & 0 & r_1 & 0 & 0 & 0 \\ 0 & 0 & 0 & r_2 & 0 & 0 \\ 0 & 0 & 0 & 0 & r_2 & 0 \\ 0 & 0 & 0 & 0 & 0 & r_2 \end{bmatrix}$$

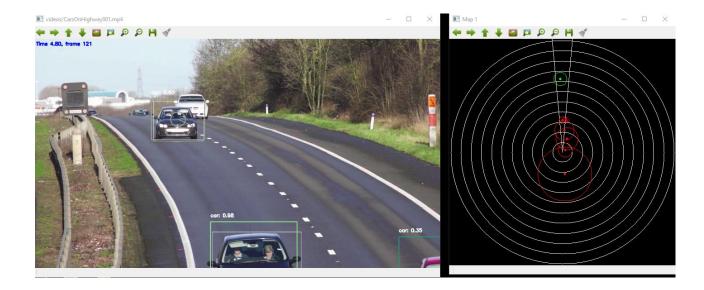

where r_1 and r_2 are believed variances of location and velocity.

$$Q = \begin{bmatrix} q & 0 & 0 \\ 0 & q & 0 \\ 0 & 0 & q \end{bmatrix}$$

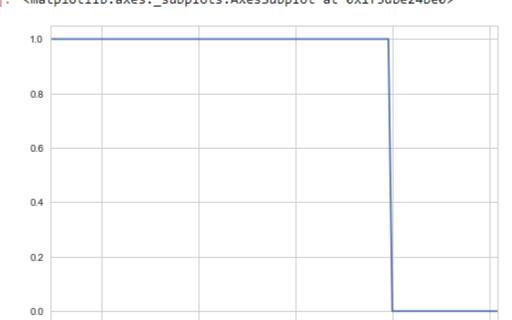

Where q is the believed measurement variance.

Kalman filter update:

$$\begin{split} \mu_1(k) &= A * \mu(k-1) \\ \Sigma_1(k) &= A * \Sigma(k-1) * A^T + R \\ K(k) &= \Sigma_1(k) * C^T(C * \Sigma_1(k) * C^T + Q)^{-1} \\ \mu(k) &= \mu_1(k) + K(k) * (Z(k) - C * \mu_1(k)) \\ \Sigma(k) &= (I - K(k) * C) * \Sigma_1(k) \end{split}$$

                    ]) # Body state equation covariance
```

Kalman filter update:

$$\begin{split} & \mu_1(k) = A * \mu(k-1) \\ & \Sigma_1(k) = A * \Sigma(k-1) * A^T + R \\ & K(k) = \Sigma_1(k) * C^T(C * \Sigma_1(k) * C^T + Q)^{-1} \\ & \mu(k) = \mu_1(k) + K(k) * (Z(k) - C * \mu_1(k)) \\ & \Sigma(k) = (I - K(k) * C) * \Sigma_1(k) \end{split}$$

- Filtering requires several seconds to achieve reliable results
- Kalman filter parameters are not optimized
- Optimization will be done later

Work in Progress

Perception

"The first step in achieving SA is to perceive the status, attributes, and dynamics of relevant elements in the environment. Thus, Level 1 SA, the most basic level of SA, involves the processes of monitoring, cue detection, and simple recognition, which lead to an awareness of multiple situational elements (objects, events, people, systems, environmental factors) and their current states (locations, conditions, modes, actions)."

Next Steps

Next steps

Comprehension:

- 1. Closing the open questions
- 2. 2d -> 3d transformation
- 3. World object state estimation

To Be Discussed

To Be Discussed

- Activity recognition?
- Emotion recognition?
- Turning camera, estimation by background movement?

Thank you!
